

Short explanation for fixes (to be submitted with Exercise 5):

ListView in Column has an “unbounded height” error → wrap Expanded or limit the height with SizedBox(height: ...).

Overflow on small screens → wrap content with SingleChildScrollView or use ListView instead of a long Column.

UI does not update when the state variable changes → use setState(() { ... }) in StatefulWidget.

DatePicker has a context error (called from a location outside of a valid widget tree) → call showDatePicker(context: context, ...) from a method in a valid State/build context.
